Five-position FRF model comparison

Independent unwrap per position, then one constant whole-curve 360-deg shift at the first plotted frequency; no smoothing.
Gray dashed: anomalous record. Thin dotted: nonconverged/provisional fit. Curve presence does not establish physical modal identity.

z = -1 mm (anomalous record) (nonconverged) | z = -0.5 mm | z = 0 mm | z = 0.5 mm | z = 1 mm
